Treatment

Autism Treatment

Treatment

The treatment performed at our clinics is a **breakthrough medical procedure where Stem Cells (cellular building blocks) are usually administered intravenously and subcutaneously (under the skin) in Autism patients.** The whole procedure takes approximately one hour and has no known negative side effects.

Following the treatment, the Our Stem Cells will travel throughout the body, detecting damaged cells and tissue and attempts to restore them. The Our Stem Cells can also stimulate existing normal cells and tissues to operate at a higher level of function, boosting the body's own repair mechanisms to aid in the healing process. These highly adaptive cells then remain in the body, continually locating and repairing any damage they encounter.

Safety

As with any medical treatment, safety should be of the highest priority. The Stem Cells used in our treatment undergo extensive screening for possible infection and impurities. Utilizing tests more sophisticated than those regularly used in the United States for Stem Cell research and transplant. **Our testing process ensures we use only the healthiest cells to enable the safest and most effective Our Stem Cell treatment possible.** And, unlike other types of Stem Cells, there is no danger of the body's rejection of Our Stem Cells due to the fact they have no antigenicity (cellular fingerprint). This unique quality eliminates the need for drugs used to suppress the immune system, which can leave a patient exposed to serious infections.

Results

With over 3000 patients treated, Western Health Center has achieved positive results with a wide variety of illnesses, conditions and injuries. Often, in cases where the diseases continued to worsen, our patients have reported substantial improvements following the Stem Cell treatment.

Commonly, positive changes are seen between three to six months post treatment in Autism patients.
